FUNDAMENTAL GROUP SCHEMES OF n-FOLD SYMMETRIC PRODUCT OF A SMOOTH PROJECTIVE CURVE

ARJUN PAUL AND RONNIE SEBASTIAN

ABSTRACT. Let k be an algebraically closed field of characteristic p > 0. Let X be an irreducible smooth projective curve of genus g over k. Fix an integer $n \geq 2$, and let $S^n(X)$ be the n-fold symmetric product of X. In this article we find the S-fundamental group scheme and Nori's fundamental group scheme of $S^n(X)$.

1. Introduction

For a connected reduced complete scheme X defined over a perfect field k and having a k-rational point x, in [Nor76, Nor82], Nori introduced an affine k-group scheme $\pi^N(X,x)$ associated to the neutral Tannakian category of essentially finite vector bundles on X, known as Nori's fundamental group scheme. This group scheme carries more informations than the étale fundamental group scheme $\pi^{\text{\'et}}(X,x)$ in positive characteristic, and is the same as $\pi^{\text{\'et}}(X,x)$ when $k=\mathbb{C}$. For a connected smooth projective curve defined over an algebraically closed field k, in [BPS06], Biswas, Parameswaran and Subramanian defined and studied the S-fundamental group scheme $\pi^S(X,x)$ of X. This is further generalized and extensively studied for higher dimensional smooth projective varieties over algebraically closed fields by Langer in [Lan11, Lan12]. It is an interesting question to find $\pi^{\text{\'et}}(X,x)$, $\pi^N(X,x)$ and $\pi^S(X,x)$ for well-known algebraic varieties.

Let X be a connected smooth projective curve defined over an algebraically closed field k of characteristic p > 0. Fix an integer $n \geq 2$, and let S_n be the permutation group of n symbols. Then S_n acts on X^n by permutation of its factors, and the associated quotient $S^n(X) := X^n/S_n$ is a connected smooth projective variety over k. For any affine k-group scheme G we denote by G_{ab} its abelianization. In this article we prove the following results.

Key words and phrases. Finite vector bundle, S-fundamental group scheme, Hilbert scheme, semistable bundle, Tannakian category.

Theorem 1 (Theorem 3.5.2). For any closed point $x \in X(k)$, there is an isomorphism of affine k-group schemes

$$\widetilde{\psi_*^S}: \pi^S(X, x)_{\mathrm{ab}} \longrightarrow \pi^S(S^n(X), nx).$$

Theorem 2 (Theorem 3.5.4). For any closed point $x \in X(k)$, there is an isomorphism of affine k-group schemes

$$\widetilde{\psi_*^N}: \pi^N(X, x)_{\mathrm{ab}} \longrightarrow \pi^N(S^n(X), nx).$$

As a consequence we also obtain the following result, which is already contained in [BH15], and proved using a different method. For any closed point $x \in X(k)$, there is an isomorphism of affine k-group schemes

$$\widetilde{\psi_{\star}^{\text{\'et}}}: \pi^{\text{\'et}}(X, x)_{\text{ab}} \longrightarrow \pi^{\text{\'et}}(S^n(X), nx).$$

Note that when n>2g-2, where g is the genus of X, these isomorphisms can be easily obtained from results in [Lan12, Section 7], since $S^n(X)$ is a projective bundle over $\mathrm{Alb}(X)$. We prove the above results without any restriction on n. Our initial strategy was to use the same method as in [PS19] under the assumption that $\mathrm{char}(k)>3$. However, we observed that one can avoid using the characterization of numerically flat sheaves as strongly semistable reflexive sheaves with vanishing Chern classes; proved in [Lan11]. Instead, we first show that $\widetilde{\psi}_*^S$ is faithfully flat and then use [Lan12, Section 7] to conclude that it is an isomorphism.

2. Fundamental Group Schemes

Let k be an algebraically closed field. Let X be a reduced proper k-scheme, which is connected in the sense that $H^0(X, \mathcal{O}_X) \cong k$.

2.1. S-fundamental group scheme. Let $\operatorname{Coh}(X)$ be the category of coherent sheaf of \mathcal{O}_X -modules on X. This has a full subcategory $\operatorname{Vect}(X)$, whose objects are locally free coherent sheaves (vector bundles) on X. A vector bundle E on X is said to be nef if $\mathcal{O}_{\mathbb{P}(E)}(1)$ is a nef line bundle on $\mathbb{P}(E)$. An object E of $\operatorname{Coh}(X)$ is said to be numerically flat if E is locally free and both E and its dual E^\vee are nef. Let $\mathscr{C}^{\operatorname{nf}}(X)$ be the full subcategory of $\operatorname{Coh}(X)$, whose objects are numerically flat vector bundles on X. It is known that, $E \in \operatorname{Ob}(\operatorname{Coh}(X))$ is an object of $\mathscr{C}^{\operatorname{nf}}(X)$ if and only if E is locally free and for any smooth projective curve E over E and any morphism E is locally free and for any smooth projective curve E over E and any morphism E is locally free and for any smooth projective curve E over E and any morphism E is locally free and for any smooth projective curve E over E and any morphism E is locally free and for any smooth projective curve E over E and any morphism E is closed under finite direct sum and tensor products. Choosing a closed point E is closed under finite direct sum and tensor products. Choosing a closed point E is locally free and define a fiber functor

$$T_x: \mathscr{C}^{\mathrm{nf}}(X) \longrightarrow \mathrm{Vect}_k$$

by sending an object E of $\mathscr{C}^{nf}(X)$ to its fiber E_x at x. The quadruple $(\mathscr{C}^{nf}(X), \otimes, \mathcal{O}_X, T_x)$ is a neutral Tannakian category (see [Lan11, Proposition 5.5]), and the affine k-group scheme $\pi^S(X, x)$ Tannaka dual to this is known as the S-fundamental group scheme of X with base point x.

Let X be a connected smooth projective variety of dimension d over k. Fix an ample divisor H on X. Let $\operatorname{Vect}_0^s(X)$ be the full subcategory of $\operatorname{Coh}(X)$, whose objects are reflexive coherent sheaves E on X, that are strongly H-semistable and $\operatorname{ch}_1(E) \cdot H^{d-1} = \operatorname{ch}_2(E) \cdot H^{d-2} = 0$, where $\operatorname{ch}_i(E)$ is the i-th Chern character of E. It is shown in [Lan11, Proposition 5.1] that the objects of the category $\operatorname{Vect}_0^s(X)$ are in fact locally free coherent sheaves on X and all of their Chern classes vanishes. It follows from [Lan11, Proposition 4.5] that the category $\operatorname{Vect}_0^s(X)$ does not depend on choice of H. For X smooth, the categories $\mathscr{C}^{\operatorname{nf}}(X)$ and $\operatorname{Vect}_0^s(X)$ are the same (see [Lan11, Proposition 5.1], [Lan12, Theorem 2.2]). We will not use this characterization here, however, this was crucial in [PS19].

It is clear from the definition of the categories $\operatorname{Vect}_0^s(X)$ and $\operatorname{EF}(X)$ that $\pi^S(X,x)$ carries more informations than $\pi^N(X,x)$. In fact, there are natural faithfully flat homomorphisms of affine k-group schemes $\pi^S(X,x) \longrightarrow \pi^N(X,x) \longrightarrow \pi^{\operatorname{\acute{e}t}}(X,x)$, (see [Lan11, Lemma 6.2]).

2.2. Nori's fundamental group scheme.

Definition 2.2.1. A vector bundle E on X is said to be finite if there are two distinct non-zero polynomials f and g with positive integer coefficients such that $f(E) \cong g(E)$.

A vector bundle E on X is said to be essentially finite if there are finitely many finite vector bundles E_1, \ldots, E_n and two numerically flat vector bundles V_1 and V_2 with $V_2 \subseteq V_1 \subseteq \bigoplus_{i=1}^n E_i$ such that $E \cong V_1/V_2$.

Let EF(X) be the full subcategory of Vect(X) whose objects are essentially finite vector bundles on X. Then EF(X) is an abelian rigid tensor category. Let $Vect_k$ be the category of k-vector spaces. Fixing a closed point $x \in X(k)$, we have a fiber functor

$$T_x: \mathrm{EF}(X) \longrightarrow \mathrm{Vect}_k$$

defined by sending a vector bundle $E \in \text{Ob}(\text{EF}(X))$ to its fiber E_x at x. This makes the quadruple $(\text{EF}(X), \otimes, \mathcal{O}_X, T_x)$ a neutral Tannakian category. The affine k-group scheme $\pi^N(X, x)$ Tannaka dual to this category is called *Nori's fundamental group scheme* of X with base point x.

3. Fundamental Group Schemes of $S^n(X)$

3.1. Symmetric product of curve. Let k be an algebraically closed field of characteristic p > 0. Let X be an irreducible smooth projective curve over

k. Fix an integer $n \geq 2$, and let us denote by S_n the permutation group of n symbols. There is a natural action of S_n on the n-fold product X^n , and the associated quotient X^n/S_n , denoted by $S^n(X)$, is a smooth projective variety of dimension n over k. Note that any closed point $q \in S^n(X)$ can be uniquely written as $\sum_{i=1}^r n_i x_i$, where x_1, \ldots, x_r are distinct closed points of X and n_1, \ldots, n_r are integers with

$$n_1 \ge \ldots \ge n_r \ge 1$$
.

We call $\langle n_1, \ldots, n_r \rangle$ the type of q. The quotient morphism

$$(3.1.1) \psi: X^n \longrightarrow S^n(X)$$

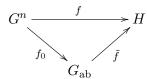

is a faithfully flat finite morphism of k-schemes.

3.2. **A group theoretic lemma.** A proof of the following easy Lemma can be found in [PS19].

Lemma 3.2.1. Let G and H be two group schemes over k. For an integer $n \geq 2$, we denote by G^n the group scheme $G \times \cdots \times G$. Then S_n acts on G^n by permuting the factors. Let f_0 be the following composite group homomorphism

$$f_0: G^n \xrightarrow{\alpha^n} (G_{ab})^n \xrightarrow{m} G_{ab}$$
,

where $\alpha:G\to G_{ab}:=G/[G,G]$ denotes the abelianization homomorphism and m denotes the multiplication homomorphism. Then a homomorphism of k-group schemes $f:G^n\longrightarrow H$ is S_n -invariant if and only if there is a homomorphism $\tilde{f}:G_{ab}\longrightarrow H$ of affine k-group schemes such that $\tilde{f}\circ f_0=f$. In other words, f is S_n -invariant iff there if \tilde{f} which makes the following diagram commutes.

3.3. Construction of homomorphism. The functor which sends $E \in \mathscr{C}^{\mathrm{nf}}(S^n(X))$ to $\psi^*E \in \mathscr{C}^{\mathrm{nf}}(X^n)$ defines a morphism of neutral Tannakian categories (for any closed point $p \in X^n(k)$)

$$(3.3.1) \quad \mathscr{F}: (\mathscr{C}^{\mathrm{nf}}(S^n(X)), \otimes, \mathcal{O}_{S^n(X)}, T_{\psi(p)}) \to (\mathscr{C}^{\mathrm{nf}}(X^n), \otimes, \mathcal{O}_{X^n}, T_p).$$

Thus, we get a homomorphism

$$\psi_*^S : \pi^S(X^n, p) \longrightarrow \pi^S(S^n(X), \psi(p)).$$

It follows from [Lan12, Theorem 4.1, p. 842] that, for any closed point $x \in X(k)$, the natural homomorphism of affine k-group schemes

$$\pi^S(X^n, (x, \dots, x)) \xrightarrow{\simeq} \pi^S(X, x)^n$$
.

is an isomorphism. By abuse of notation, denote by ψ_*^S the composite of the inverse of this isomorphism and ψ_*^S . So now

(3.3.2)
$$\psi_*^S : \pi^S(X, x)^n \to \pi^S(S^n(X), nx),$$

where $nx = \psi(x, \dots, x)$.

The natural S_n -action on X^n gives rise to automorphisms σ_* of the affine k-group scheme $\pi^S(X^n,(x,\ldots,x)) \cong \pi^S(X,x)^n$, for all $\sigma \in S_n$. Now one can check that $\psi_*^S \circ \sigma_* = \psi_*^S$, where ψ_*^S is the homomorphism defined in (3.3.2) with $p = (x,\ldots,x)$. Consider the natural homomorphism of affine k-group schemes

$$\phi: \pi^S(X, x)^n \longrightarrow \pi^S(X, x)_{ab}$$

defined as the following composite homomorphism

$$\pi^S(X,x)^n \longrightarrow (\pi^S(X,x)_{ab})^n \xrightarrow{m} \pi^S(X,x)_{ab},$$

where the first homomorphism is given by abelianization at each factor, and the second homomorphism is the multiplication. Then it follows from Lemma 3.2.1 that the homomorphism ψ_*^S in (3.3.2) factors through a homomorphism

(3.3.3)
$$\widetilde{\psi_*^S} : \pi^S(X, x)_{ab} \longrightarrow \pi^S(S^n(X), nx).$$

We record the above discussion in the following proposition.

Proposition 3.3.4. The map

$$\psi_*^S : \pi^S(X^n, (x, \dots, x)) \longrightarrow \pi^S(S^n(X), \psi(x, \dots, x))$$

factors to give a homomorphism $\widetilde{\psi_*^S}: \pi^S(X,x)_{ab} \longrightarrow \pi^S(S^n(X),nx).$

A vector bundle E on X^n is said to be S_n -invariant if $\sigma^*E \cong E$, for all $\sigma \in S_n$.

Proposition 3.3.5. Let E be a vector bundle in $\mathscr{C}^{nf}(X^n)$ associated to a representation $\rho: \pi^S(X^n, (x, \ldots, x)) \cong \pi^S(X, x)^n \to GL(V)$. If ρ factors through $\pi^S(X, x)_{ab}$, as in Lemma 3.2.1, then E is S_n -invariant.

Proof. From the hypothesis it follows that $\rho \circ \sigma_* = \rho$. The proposition follows.

3.4. Faithfully flat. In this subsection we use [DMOS82, Proposition 2.21] to show that the homomorphism $\widetilde{\psi_*^S}$ in (3.3.3) is faithfully flat. We begin by recalling this result for the convenience of the reader. Let $\theta: G \longrightarrow G'$ be a homomorphism of affine group schemes over k, and let

$$(3.4.1) \qquad \widetilde{\theta}: \operatorname{Rep}_k(G') \longrightarrow \operatorname{Rep}_k(G)$$

be the functor given by sending $\rho': G' \to \operatorname{GL}(V)$ to $\rho' \circ \theta: G \to \operatorname{GL}(V)$. An object $\rho: G \to \operatorname{GL}(V)$ in $\operatorname{Rep}_k(G)$ is said to be a *subquotient* of an object $\eta: G \to \operatorname{GL}(W)$ in $\operatorname{Rep}_k(G)$ if there are two G-submodules $V_1 \subset V_2$ of W such that $V \cong V_2/V_1$ as G-modules.

Proposition 3.4.2 (Proposition 2.21, [DMOS82]). Let $\theta: G \longrightarrow G'$ be a homomorphism of affine algebraic groups over k. Then

- (a) θ is faithfully flat if and only if the functor $\widetilde{\theta}$ in (3.4.1) is fully faithful and given any subobject $W \subset \widetilde{\theta}(V')$, with $V' \in \operatorname{Rep}_k(G')$, there is a subobject $W' \subset V'$ in $\operatorname{Rep}_k(G')$ such that $\widetilde{\theta}(W') \cong W$ in $\operatorname{Rep}_k(G)$.
- (b) f is a closed immersion if and only if every object of $\operatorname{Rep}_k(G)$ is isomorphic to a subquotient of an object of the form $\widetilde{\theta}(V')$, for some $V' \in \operatorname{Rep}_k(G')$.

Proposition 3.4.3. The homomorphism

$$\widetilde{\psi_*^S}: \pi^S(X, x)_{ab} \longrightarrow \pi^S(S^n(X), nx)$$

defined in (3.3.3) is faithfully flat.

Proof. We will apply [DMOS82, Proposition 2.21 (a)]. Let E_1 be an object in the category $\mathscr{C}^{\mathrm{nf}}(S^n(X))$. Clearly ψ^*E_1 has the same rank as that of E_1 . If $\mathcal{E}_2 \subset \mathcal{E}_1 := \psi^*E_1$ is a subbundle corresponding to a representation of $\pi^S(X,x)_{\mathrm{ab}}$, we need to show that there is a subbundle $E_2 \subset E_1$ such that $\psi^*E_2 = \mathcal{E}_2$. We will prove this by induction on rank of E_1 . If $\mathrm{rank}(E_1) = 1$, there is nothing to prove. Assume that $\mathrm{rank}(E_1) \geq 2$.

The vector bundles \mathcal{E}_i corresponds to a representation

$$\pi^S(X^n, (x, \dots, x)) \xrightarrow{f_0} \pi^S(X, x)_{ab} \xrightarrow{\rho_i} GL(V_i), \quad \forall \ i = 1, 2.$$

It follows from Proposition 3.3.5 that \mathcal{E}_2 is a S_n -invariant numerically flat vector bundle on X^n . Since $\pi^S(X,x)_{ab}$ is an abelian k-group scheme, it follows from [Wat79, Theorem 9.4, p. 70], that we can find a surjective $\pi^S(X,x)_{ab}$ -module homomorphism $V_1 \to L_1$, where L_1 is one dimensional and V_2 is a $\pi^S(X,x)_{ab}$ -submodule of the kernel of this homomorphism. Let \mathcal{L} be the line bundle on X^n corresponding to the representation L_1 . Then it is clear that \mathcal{L} is S_n -invariant (see Proposition 3.3.5) and there is an S_n -equivariant exact sequence of vector bundles

$$0 \longrightarrow \mathcal{K} \longrightarrow \mathcal{E}_1 \longrightarrow \mathcal{L} \longrightarrow 0$$

on X^n such that $\mathcal{E}_2 \subset \mathcal{K}$.

Every S_n -equivariant line bundle on X^n is the pullback of a line bundle from $S^n(X)$ (see [Fog77, Proposition 3.6], also [PS19, Proposition 5.1.1]). Therefore, it follows that $L := (\psi_* \mathcal{L})^{S_n}$ is a line bundle on all of $S^n(X)$. We now show that L is numerically flat on $S^n(X)$. Given a morphism $C \longrightarrow S^n(X)$ from a smooth projective curve C into $S^n(X)$, we can find a curve

 \widetilde{C} and a morphism $\widetilde{C} \longrightarrow C$ making the following diagram commutative.

$$\widetilde{C} \longrightarrow X^{n} \\
\downarrow \psi \\
C \longrightarrow S^{n}(X)$$

Since \mathcal{L} is numerically flat on X^n and $\mathcal{L} \cong \psi^* L$, it follows that L is numerically flat.

We claim that

$$(3.4.4) 0 \to (\psi_* \mathcal{K})^{S_n} \longrightarrow (\psi_* \mathcal{E}_1)^{S_n} \cong E_1 \xrightarrow{q} (\psi_* \mathcal{L})^{S_n} = L \longrightarrow 0$$

is exact. The sequence (3.4.4) can fail to be exact only on the right. Since both E_1 and L are numerically flat and L is a line bundle, q is surjective since it is nonzero. This proves the exactness of (3.4.4). It follows that $K := (\psi_* \mathcal{K})^{S_n}$ is locally free and numerically flat on $S^n(X)$. It is clear that $\psi^* K = \mathcal{K}$ on X^n . Since $\mathcal{E}_2 \subset \mathcal{K}$ the assertion that there is $E_2 \subset E_1$ such that $\mathcal{E}_2 = \psi^* E_2$ on X^n follows by induction on rank.

To complete the proof of the Proposition, we need to show that if E_1 and E_2 are numerically flat vector bundles on $S^n(X)$ then the natural map

$$\operatorname{Hom}_{S^n(X)}(E_1, E_2) \longrightarrow \operatorname{Hom}_{X^n}(\psi^* E_1, \psi^* E_2)$$

is bijective. It is clear that this natural map is injective (faithful). Therefore, it suffices to show that given any numerically flat vector bundle E on $S^n(X)$, any nonzero homomorphism $\phi: \mathcal{O}_{S^n(X)} \longrightarrow E$. Since the homomorphism $\pi^S(X^n,x) \longrightarrow \pi^S(X,x)_{ab}$ is faithfully flat, and ψ^*E corresponds to a representation of $\pi^S(X,x)_{ab}$, it follows that ϕ is a morphism between two representations of $\pi^S(X,x)_{ab}$. This shows that ϕ is S_n -equivariant on X^n . Now from the preceding discussion it follows that ϕ arises from a morphism $\mathcal{O}_{S^n(X)} \longrightarrow E$.

3.5. **Proofs of Theorems.** The following Lemma 3.5.1 is probably well-known to experts, but we could not found precise reference, and so include a proof.

Lemma 3.5.1. Let X be a connected smooth projective variety over k, and $f: Y \longrightarrow X$ a projective bundle over X. Then the natural homomorphism of S-fundamental group schemes

$$f_*^S: \pi^S(Y, y) \longrightarrow \pi^S(X, f(x))$$

is an isomorphism, for all $y \in Y$.

Proof. It follows from [Lan11, Lemma 8.1] that the homomorphism f_*^S is faithfully flat. Let E be a numerically flat vector bundle on Y. Then it follows from [Har77, Chapter III, Corollary 12.9, p. 288] that f_*E is locally

free on X and the natural homomorphism $f^*f_*E \longrightarrow E$ is an isomorphism. Therefore, f_*E is numerically flat over X. Now it follows from [DMOS82, Proposition 2.21(b)] that f_*^S is a closed immersion.

Theorem 3.5.2. The homomorphism of affine k-group schemes

$$\widetilde{\psi_*^S}: \pi^S(X, x)_{\mathrm{ab}} \longrightarrow \pi^S(S^n(X), nx)$$

is an isomorphism, for all $x \in X(k)$.

Proof. Let Alb(X) be the Albanese variety of X. Let g be the genus of the curve X. If $n \geq 2g - 1$, then the morphism $\eta: S^n(X) \to \text{Alb}(X)$ given by

$$\sum_{i=1}^{n} x_i \mapsto \sum_{i=1}^{n} x_i - nx,$$

makes $S^n(X)$ into a projective bundle over Alb(X). It follows from above Lemma 3.5.1 that the induced homomorphism of affine k-group schemes

$$\eta_*: \pi^S(S^n(X), nx) \to \pi^S(\mathrm{Alb}(X), 0)$$

is an isomorphism. From [Lan12, Section 7] it follows that the Albanese morphism $alb_X: X \longrightarrow Alb(X)$ given by $t \mapsto t - x$ induces an isomorphism $alb_*: \pi^S(X,x)_{ab} \xrightarrow{\sim} \pi^S(Alb(X),0)$. Thus, if $n \geq 2g-1$, then the theorem is proved. Assume that n < 2g-1. Consider the maps

$$X \xrightarrow{a} X^n \xrightarrow{\psi} S^n(X) \xrightarrow{c} S^{2g-1}(X) \xrightarrow{\eta} \text{Alb}(X),$$

where $a(t)=(t,x,x,\ldots,x)$ and $c(\sum_{i=1}^n x_i)=\sum_{i=1}^n x_i+(2g-1-n)x$. It is clear that the composite morphism is alb_X . It is also clear (see Lemma 3.2.1) that $(\psi\circ a)_*$ factors through $\pi^S(X,x)_{\mathrm{ab}}$. Thus, we get homomorphisms of affine k-group schemes

$$\pi^S(X, x)_{ab} \twoheadrightarrow \pi^S(S^n(X), nx) \to \pi^S(Alb(X), 0),$$

and that the composite homomorphism is an isomorphism. This forces that the first map is a closed immersion. Since we know from Proposition 3.4.3 that the first map is faithfully flat, the theorem follows.

Remark 3.5.3. That $\widetilde{\psi_*^S}$ is a closed immersion could have been proved using the same method in [PS19] under the assumption that $\operatorname{char}(k) > 3$.

Let X be a reduced proper k-scheme with $H^0(X, \mathcal{O}_X) = k$. Let E be an essentially finite vector bundle on X. Then there is a finite k-group scheme G, a principal G-bundle $p: P \to X$ and a finite dimensional k-linear representation $\rho: G \to \operatorname{GL}(W)$ such that $E \cong P \times^{\rho} W$, the vector bundle associated to the representation ρ . It follows from the proof of [Nor76, Proposition 3.8] that there is a finite vector bundle \mathcal{V} on X such that E is a subbundle of \mathcal{V} .

As before, let X be a connected smooth projective curve over k and $S^n(X)$ the n-fold symmetric product of X. It is clear that the functor \mathscr{F}

defined in (3.3.1) takes a finite vector bundle to a finite vector bundle. Thus, $\mathscr{F}(E) \subset \mathscr{F}(\mathcal{V})$, which shows that \mathscr{F} takes essentially finite vector bundles to essentially finite vector bundles Note that there is a commutative diagram of homomorphisms of affine k-group schemes

$$\pi^{S}(X,x)_{ab} \xrightarrow{\simeq} \pi^{S}(S^{n}(X), nx)$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad \downarrow$$

$$\pi^{N}(X,x)_{ab} \xrightarrow{\widetilde{\psi_{*}^{N}}} \pi^{N}(S^{n}(X), nx)$$

where the vertical arrows are faithfully flat by [Lan11, Lemma 6.2]. It follows that $\widetilde{\psi_*^N}$ is faithfully flat.

Now let \mathcal{E} be an essentially finite S_n -equivariant vector bundle on X^n . It is easy to find a finite and S_n -equivariant bundle \mathcal{V} on X^n and an S_n -equivariant inclusion $\mathcal{E} \subset \mathcal{V}$. Define $E = (\psi_* \mathcal{E})^{S_n}$ and $V := (\psi_* \mathcal{V})^{S_n}$. It is clear that V is a finite vector bundle (see also [PS19, Proposition 5.4.2]) and $E \subset V$. So E is essentially finite and $\mathscr{F}(E) = \mathcal{E}$. This shows that \widetilde{f}^N is a closed immersion. Thus, we have the following.

Theorem 3.5.4. There is a natural isomorphism of affine k-group schemes $\widetilde{\psi_*^N}: \pi^N(X,x)_{ab} \longrightarrow \pi^N(S^n(X),nx).$

3.6. Étale Fundamental Group Scheme of $S^n(X)$. In this subsection we sketch how to deduce from Theorem 3.5.4 the same assertion for étale fundamental group schemes. This result is a special case of [BH15, Theorem 1.2]. Note that there is a commutative diagram

$$\pi^{N}(X,x) \longrightarrow \pi^{N}(X,x)_{ab} \xrightarrow{\sim} \pi^{N}(S^{n}(X),nx)$$

$$\downarrow \qquad \qquad \downarrow d$$

$$\pi^{\text{\'et}}(X,x) \longrightarrow \pi^{\text{\'et}}(X,x)_{ab} \longrightarrow \pi^{\text{\'et}}(S^{n}(X),nx).$$

From this it follows that $\pi^{\text{\'et}}(X,x)_{ab} \longrightarrow \pi^{\text{\'et}}(S^n(X),nx)$ is faithfully flat. Consider a homomorphism $\pi^{\text{\'et}}(X,x)_{ab} \to \operatorname{GL}(V)$. It follows using [Nor76, Proposition 3.10] that this homomorphism factors through a finite and reduced k-group scheme G. Now consider the diagram

$$\pi^{N}(X,x)_{ab} \xrightarrow{\sim} \pi^{N}(S^{n}(X),nx) \xrightarrow{d} \pi^{\text{\'et}}(S^{n}(X),nx)$$

$$\downarrow \qquad \qquad \downarrow \qquad \qquad$$

The right vertical arrow is the unique map which makes the square commute. It factors through d since G is finite and reduced. Now it follows from [DMOS82, Proposition 2.21 (b)] that $\pi^{\text{\'et}}(X,x)_{ab} \longrightarrow \pi^{\text{\'et}}(S^n(X),nx)$ is a closed immersion. This proves the following.

Theorem 3.6.1. For any closed point $x \in X(k)$, there is an isomorphism of affine k-group schemes

$$\widetilde{\psi_*^{\text{\'et}}}: \pi^{\text{\'et}}(X, x)_{\text{ab}} \longrightarrow \pi^{\text{\'et}}(S^n(X), nx).$$
